

**The tool is just the
hammer.
The platform is the house.**

Build with AI speed. Govern with enterprise confidence.

The Innovative Maker is the **game changer**.

Business Innovators start in **vibe.powerapps.com** — describe an idea, ship a working app. Pro Developers ship in **VS Code** with an approved AI coding assistant and full CI/CD. In between sits the persona that breaks the old ceiling: the **Innovative Maker**, who fluidly moves between **vibe.powerapps.com** and **VS Code** — *given incredible AI superpowers, but contained and controlled by the platform.*

1

IDEATE & BUILD

Business Innovator

vibe.powerapps.com

- ✓ Describe the idea in natural language
- ✓ AI builds the first working app
- ✓ Validate with real users in days
- ✓ Hand off — or keep going

★ GAME CHANGER

2

CROSS-OVER · CONTAINED SUPERPOWERS

Innovative Maker

vibe.powerapps.com **and** VS Code + approved AI assistant

- ✓ Starts in vibe.powerapps.com *or* VS Code — whichever fits the task
- ✓ Pulls Code Apps into VS Code when vibe hits a ceiling — and keeps building from there
- ✓ Uses approved agent tooling to extend, refactor, and harden at AI speed
- ✓ Guardrails via `copilot-instructions.md` and `AGENTS.md`
- ✓ **Same artifact, same Dataverse, same governance — either way**

3

HARDEN & SCALE

Pro Developer

VS Code + GitHub + ALM

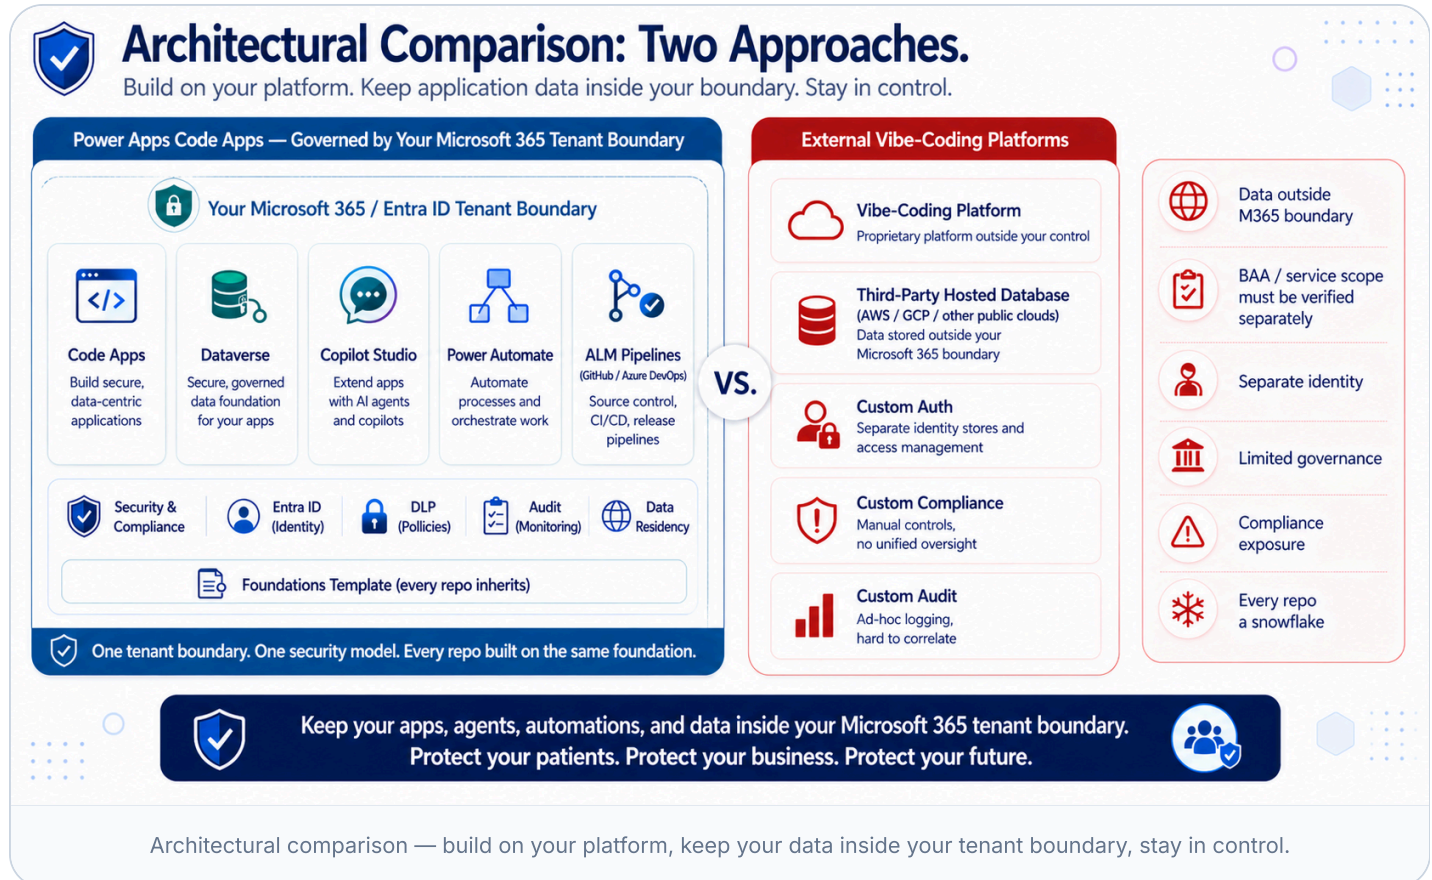

- ✓ Custom components, integrations, complex logic
- ✓ Source control, code review, CI/CD pipelines
- ✓ Performance, security, observability
- ✓ Ship to Managed Environments with confidence

These are roles, not necessarily different people. Often a Business Innovator *becomes* the Innovative Maker the moment vibe hits its limit — and the platform makes that step continuous instead of a cliff. The Pro Developer joins

when CI/CD, custom components, or hardening matter. Same solution, same Dataverse, same governance throughout — **that's what makes the cross-over safe.**

Configure once. Let 1,000 makers self-serve.

Admins configure ALM pipelines and **Managed Environments** once. After that, makers ship to dev → test → prod with proper promotion, DLP, and approval gates baked in.

✓ Code Apps + Managed Environments

- ✓ One-time admin setup of pipelines, DLP, and environment groups
- ✓ Makers self-serve deployments — guardrails enforced automatically
- ✓ **Every repo inherits the same governed foundation** — instructions, ALM, security, tests, agent guardrails — from a versioned template (see [Chapter 10](#))
- ✓ Update the foundation once → every downstream repo can pull it in
- ✓ Solution packaging carries data model + UI + logic together
- ✓ Tenant-wide audit, telemetry, and CoE visibility across the fleet

External Vibe Platforms — Repos Without a Foundation

- ✗ **Every repo starts from scratch** — no inherited instructions, no inherited ALM, no inherited tests
- ✗ Governance must be re-invented per repo, per team
- ✗ Each external data backend (hosted Postgres, Firebase, Supabase, etc.) is its own snowflake
- ✗ No tenant-wide DLP, no native solution packaging, no way to push a fix across the fleet
- ✗ **Estimated +1.5 to +2.5 FTEs** of platform/governance overhead at scale (illustrative, varies by org)

The problem isn't repo count — Code Apps create plenty of repos too. The problem is repos that don't inherit a common foundation.

This is not a feature comparison. It is a boundary.

For any organization handling PHI, this single chapter changes the conversation. It's a contractual and regulatory boundary — not a preference.

INSIDE YOUR TENANT BOUNDARY

Your application data stays governed, protected, and under your control.

Your Microsoft 365 / Entra ID Tenant

**Dataverse —
PHI / PII / Regulated Data**

BAA-covered platform/data services

Data Residency

Your data stays in the regions you choose.

Field-level Audit

Track who accessed what, when, and why.

Microsoft Purview eDiscovery

Legal hold, eDiscovery, and content search.

FedRAMP High (commercial cloud)

Rigorous security and continuous monitoring.

VS.

OUTSIDE YOUR TENANT BOUNDARY

Data may leave your control and enter a third-party environment.

**External Vibe-Coding Platform —
Third-Party Hosted Backend**

Data stored and processed outside your Microsoft 365 / Entra ID boundary.

BAA must be verified

Coverage depends on the vendor, contract, service, and configuration.

PHI may be prohibited

Many platform terms restrict or prohibit regulated health data.

Outside M365 Boundary

Outside your Microsoft 365 / Entra ID tenant boundary.

Third-Party Public Cloud

Infrastructure and data handled outside your platform controls.

Always verify the legal posture, BAA scope, and service configuration before regulated data is used.

Data must stay inside your tenant boundary — protect patient data, preserve compliance, maintain trust.

Inside the Fence

CODE APPS WITH DATAVERSE

- ✓ Microsoft-operated SaaS governed by your **Microsoft 365 / Entra ID tenant boundary**, with regional data residency
- ✓ Covered by a **signed Microsoft BAA**
- ✓ PHI, PII, and regulated workloads explicitly supported
- ✓ FedRAMP High and HITRUST attestations apply on the Microsoft commercial cloud; sovereign-cloud options (GCC, GCC High, DoD) available — verify Code Apps availability in your target cloud
- ✓ Field-level audit and change tracking native to Dataverse; integrated with Microsoft Purview eDiscovery

Outside the Boundary

EXTERNAL VIBE-CODING PLATFORMS

- ✗ Default data layer is a **third-party hosted backend** (hosted Postgres, Firebase, Supabase, etc.) on a public cloud you don't control — outside your Microsoft 365 tenant boundary
- ✗ No Microsoft BAA coverage
- ✗ Many of these platforms' **own published terms explicitly prohibit PHI** — see proof drawer below for one transparent example
- ✗ Cannot be easily relocated into a customer-controlled Microsoft cloud boundary

SCOPE NOTE

This boundary describes the **application platform and data layer**. Coding assistants are selected separately: teams handling regulated data should route prompts only through AI services their legal and security teams have approved for that workload.

This pattern is common across the category. We use **Lovable** here as a representative example because their terms are particularly explicit. Replit, Bolt, v0, and similar platforms typically carry comparable restrictions in their own published terms — always verify the current legal documents of any platform you evaluate.

TERMS & CONDITIONS [lovable.dev/terms \(https://lovable.dev/terms\)](https://lovable.dev/terms)

*"You agree not to upload, input, or otherwise provide any **protected health information under HIPAA**, or any other sensitive categories of data... Our Services are **not designed to handle that type of data**, and we disclaim all responsibility if you choose to submit it."*

DATA PROCESSING AGREEMENT · §8

[lovable.dev/data-processing-agreement \(https://lovable.dev/data-processing-agreement\)](https://lovable.dev/data-processing-agreement)

*"The Customer shall **not provide any data to Lovable which is classified as sensitive**. For the avoidance of doubt, the Customer agrees not to upload... any **protected health information under HIPAA**..."*

PRIVACY POLICY [lovable.dev/privacy \(https://lovable.dev/privacy\)](https://lovable.dev/privacy)

Explicitly warns against uploading sensitive health data.

KEY TAKEAWAY FOR HEALTHCARE & LIFE SCIENCES

Microsoft signs a BAA and keeps your data inside your Microsoft 365 tenant boundary. The **external vibe-coding category, broadly, does not** — and many of these platforms explicitly prohibit PHI in their own published terms. Always confirm the legal posture of any platform before letting regulated data near it.

One intelligent connection for agents.

In the era of intelligent agents, the data layer must speak the agent's language. Many databases now ship MCP servers — including Azure SQL, Cosmos DB, and Postgres — but they expose *schema*. **Dataverse's MCP exposes business semantics:** security roles, business units, business rules, choice sets, relationships, and audit — the things agents actually need to act safely on enterprise data.

DATAVERSE

Total context. One connection.

- ✓ Auto-discover tables, columns, relationships
- ✓ Row & column security flow through
- ✓ Business rules & choice sets introspectable
- ✓ Copilot Studio, M365 Copilot, custom agents

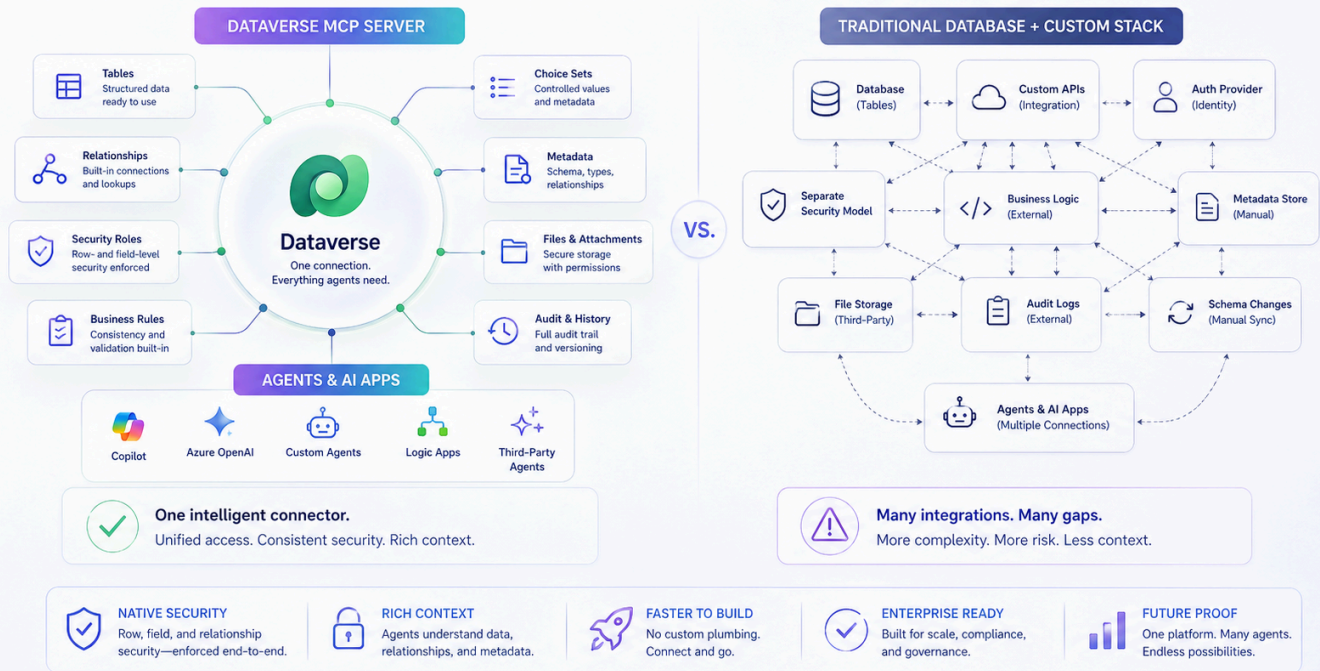

SCHEMA-ONLY MCP

Plumbing without meaning.

- ✗ MCP exposes columns and types, not business rules or security roles
- ✗ Row/column security must be re-described to every agent
- ✗ Constant drift between schema, prompts, and policy
- ✗ Each new agent restarts the integration cost

Dataverse: One Intelligent Connection for Agents

Expose data, relationships, and security to agents—natively and securely.

Dataverse exposes tables, relationships, metadata, security, and business rules — natively to agents.

Two Doors. One Foundation.

Different audiences. Same data. Same governance. One trusted platform.

Two Doors. One Foundation.

Different audiences. Same data. Same governance. One trusted platform.

DIFFERENT AUDIENCES. SAME DATA. SAME GOVERNANCE. ONE TRUSTED PLATFORM.

Internal Workforce

CODE APPS · ENTRA ID

- ✓ Modern internal apps with React + Dataverse
- ✓ Secure access with Entra ID
- ✓ Built-in governance, DLP, and ALM

External Ecosystem

POWER PAGES · BYOC

- ✓ Customers, patients, partners, suppliers
- ✓ Modern React on the secure Power Pages runtime
- ✓ Same Dataverse security, end-to-end

ONE PLATFORM

One data foundation

ONE SECURITY

Identity, roles, access

ONE ALM

Build once. Govern always.

ONE TRUTH

Clean, trusted data

ONE EXPERIENCE

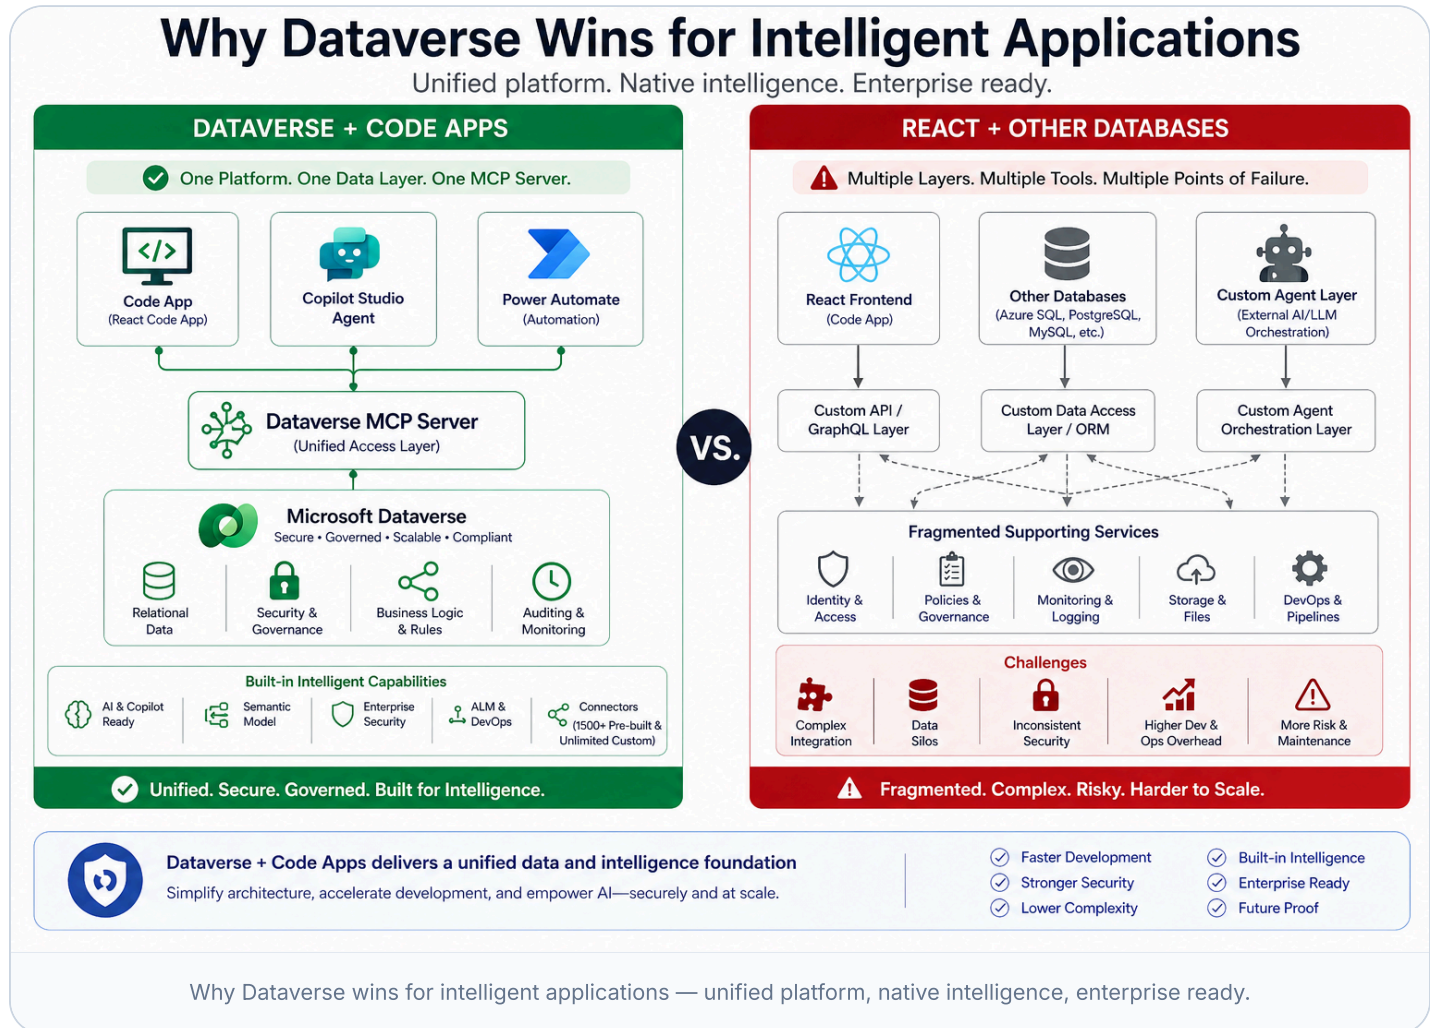

Users · Builders · Business

ONE FOUNDATION

Built to scale & last

A traditional database is just a database. Dataverse is a platform.

Dataverse is a governed business application platform. The difference shows up in nearly every dimension that matters at enterprise scale.

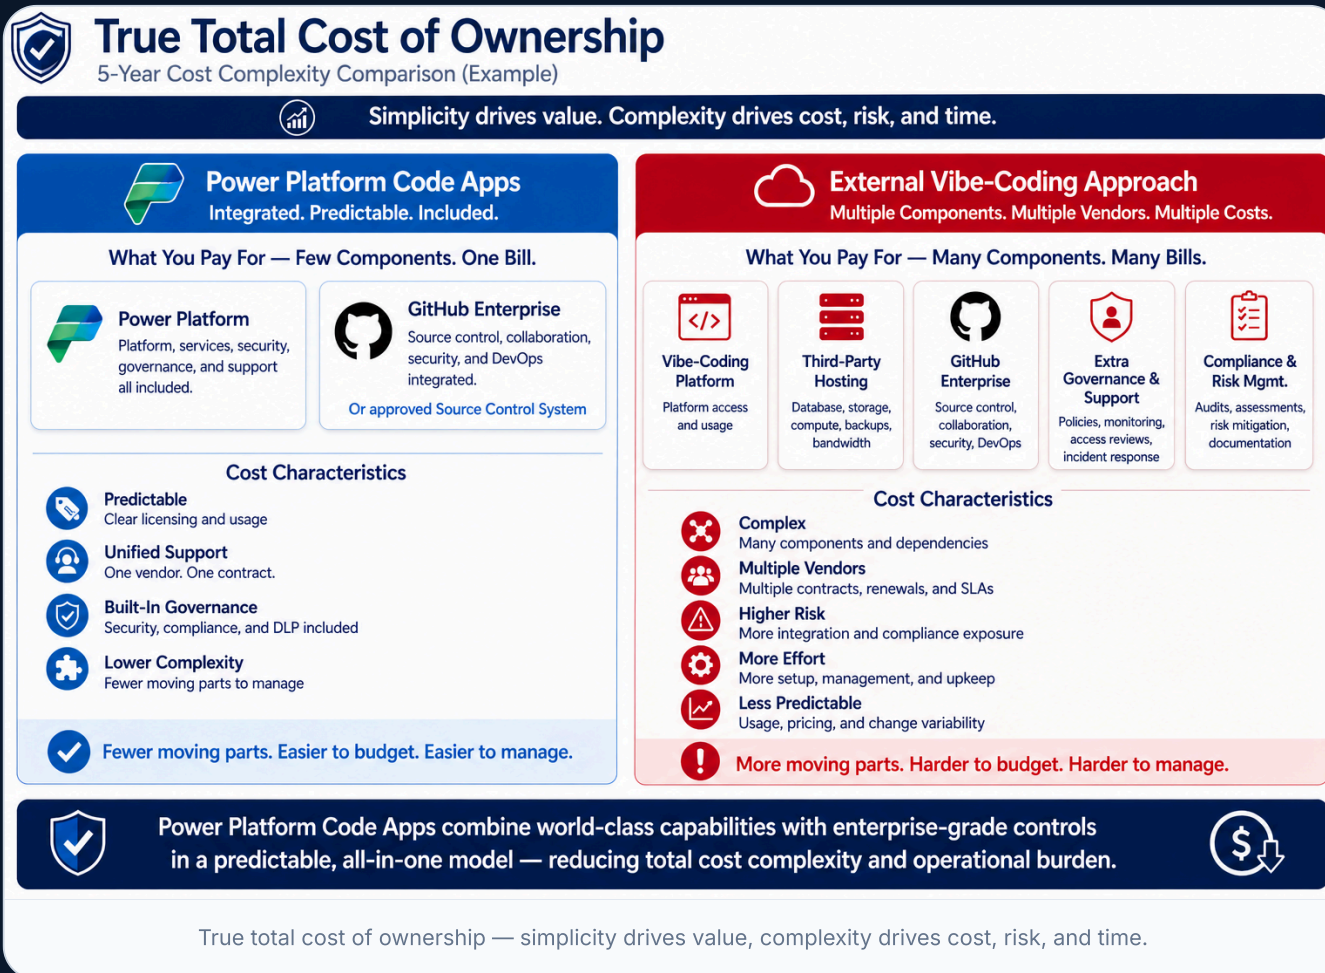

CAPABILITY	DATAVERSE	OTHER DATABASES
Row & column security	✓ Built-in security roles, business units, hierarchical, field-level	✗ Custom-built with views, RLS policies, and app-tier code
MCP Server	✓ Native — exposes business semantics: security roles, business	✗ Where MCP exists, exposes <i>schema only</i> — security and

	rules, choice sets, relationships, audit	business rules must be re-described per agent
Agent intelligence	✓ Copilot Studio + M365 Copilot speak Dataverse natively	✗ Requires bespoke prompt engineering and middleware
Business logic location	✓ Centralized: business rules, plug-ins, flows	✗ Scattered across app code, stored procs, triggers, services
ALM & solution packaging	✓ First-class solutions carry schema + UI + logic together	✗ DACPAC + custom scripts + bespoke release pipelines
Show 4 more rows ▾		

The hidden cost of tool sprawl.

Simplicity drives value. Complexity drives cost, risk, and time.

We deliberately don't put dollar signs here — pricing varies by scale, region, and deal. The point is the **shape** of the cost structure.

POWER PLATFORM CODE APPS

Integrated. Predictable. Included.

What you pay for: Few components. One bill.

Power Platform

Platform, services, security, governance, support — all included

GitHub Enterprise

Source control, collaboration, security, DevOps

Predictable

Clear licensing

Unified Support

One vendor

Built-in Governance

Compliance & ALM

Future-Compatible

Fewer parts

EXTERNAL VIBE PLATFORM APPROACH

Many components. Many bills.

What you pay for: Many components. Many bills.

VP

Vibe-Coding Platform

Subscription, usage, compute, backups

DB

Third-Party Data Backend

Hosted database on AWS / GCP / other public clouds — storage, networking

GH

GitHub Enterprise

Repos, security, governance, DevOps

+G

Extra Governance & Support

Policies, monitoring, incident response, added FTEs

C&R

Compliance & Risk Mgmt

Audit, logging, certifications, documentation

Complex

Multiple bills

Higher Risk

More integration surface

Reduced Reliability

Less consistency

Higher Maintenance

Vendor sprawl

BOTTOM LINE

One platform. Fewer moving parts. Greater value.

Bring the right frontier model. Always know which one you're using.

Coding-model leadership shifts month to month. The **VS Code ecosystem** lets developers use the assistant route their organization approves — GitHub Copilot, Claude Code, Codex, Cursor, Cline, or direct API integrations — while still building the same governed Code App on Dataverse. The point is not one assistant. It is transparent routing, named models, and a platform foundation that remains consistent as the AI layer changes.

Below: a cross-section of leading coding models and assistant surfaces available across the VS Code ecosystem in 2026. Availability, contractual coverage, and data-handling posture vary by route; regulated teams should validate the approved path with legal, security, and procurement.

ANTHROPIC

Claude Opus 4.x

Sonnet 4.x · Haiku 4.5

Industry-leading agentic coding & long-horizon refactors.

OPENAI

GPT-5 / GPT-5 Codex

o-series reasoning

Strong general coding & deep reasoning workflows.

GOOGLE

Gemini 2.5 Pro

Gemini Code Assist

Massive context windows for whole-repo reasoning.

GITHUB

GitHub Copilot

Multi-model: Claude · GPT · Gemini

A productive default for many workloads; confirm fit for regulated data-handling scenarios.

CURSOR

Cursor + Composer

Routes to Claude / GPT / Gemini

IDE-native agent loops, model of your choice.

XAI

Grok Code

Grok 4 family

Real-time web context for current API knowledge.

DEEPSEEK

DeepSeek-Coder V3

Open-weights option

Strong code completion at lower cost-per-token.

ALIBABA

Qwen Coder

Open-weights, multilingual

Self-hostable for sovereign workloads.

The cadence is the point: new frontier coding models drop every few weeks. Within **days to weeks** of release, they typically appear in at least one VS Code-compatible surface — GitHub Copilot, Cursor, Cline, or direct API integrations. Yesterday's leader rarely stays the leader for long — and your developers will always know which one they're running.

GitHub Copilot

A strong default for many developer workflows. Treat it as one approved option, not the only AI path.

Claude Code via Azure AI Foundry

For Claude-based agent work, route the CLI or VS Code extension to an approved Foundry-hosted endpoint where available.

Codex via Azure OpenAI

For OpenAI coding agents, route through your Azure OpenAI resource using Entra ID or managed keys under your Azure controls.

The practical pattern is simple: keep the **application, data model, ALM, and governance** in Code Apps + Dataverse, then let legal and security approve which AI assistant endpoint can receive prompts for each workload. For PHI-adjacent scenarios, confirm the applicable BAA and service scope in writing before enabling that route.

Code Apps — Open & Transparent

- ✓ **Named, versioned models** — you always know what wrote your code
- ✓ Approved VS Code assistants work here: Copilot, Claude Code, Codex, Cursor, Cline, or direct APIs
- ✓ Switch per repo, per developer, per task — based on both capability and compliance posture
- ✓ Enterprise controls depend on the approved route: GitHub Enterprise, Azure OpenAI, Azure AI Foundry, or other governed endpoints
- ✓ `copilot-instructions.md` sets guardrails across every assistant
- ✓ New frontier model today → available within days

External Vibe Platforms — Opaque Models

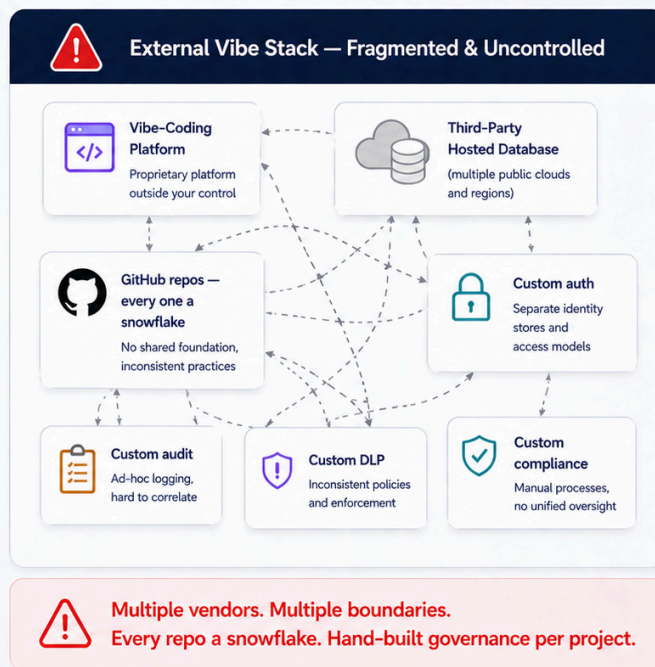

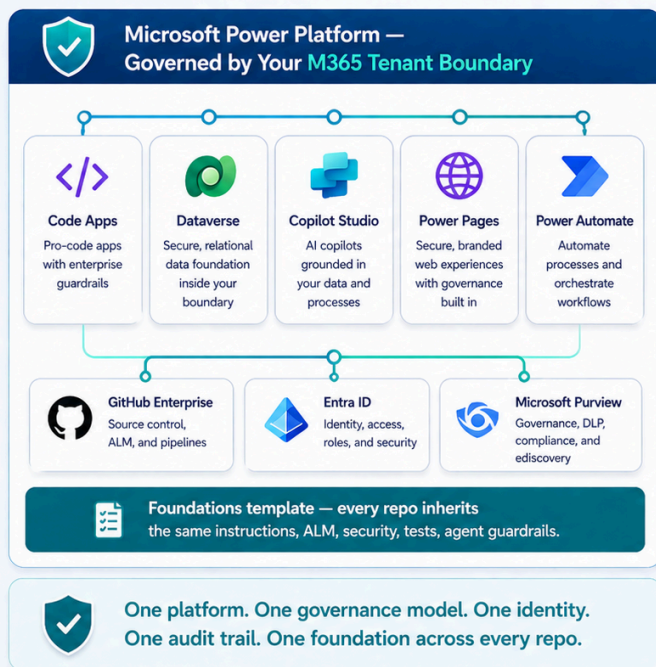

- ✗ **No model transparency** — you don't know which model or version
- ✗ Cannot verify whether you're on the latest frontier capability
- ✗ The platform vendor decides the model roster — switching is not yours
- ✗ No version history, no audit trail of which model produced what
- ✗ Enterprise key management lives outside customer control
- ✗ In a landscape that shifts weekly, opacity is a liability

CHAPTER 09 · THE BIGGER PICTURE

Fragmentation feels fast at first. Platform coherence wins at scale.

One Platform. One Foundation. Total Control.

Unified under your Microsoft 365 tenant boundary vs. fragmented across external boundaries.

Unified platform vs fragmented tools — connected, governed, reliable, built to scale.

Getting started is the hardest part — until now.

Most teams spend their first month discovering platform quirks the hard way.

PAppsCAFoundations encodes every one of those lessons into a repeatable, tested path — so your team builds features on day one, not debugs platform quirks.

Your Path to Success with Power Apps Code Apps

A proven foundation. A clear path. Faster to value.

Power Platform

Dataverse

React

GitHub

Approved AI Assistants

Getting Started is the Hardest Part...

- ❓ Too many decisions
- 📋 Scattered setup steps
- ⚙️ Inconsistent patterns
- 🕒 Wasted time
- ⚠️ Higher risk

PAppsCAFoundations
<https://aka.ms/codeappsfoundations>

...But Now There's a Clear Path!

- ✓ Clear, proven path
- ✓ Best practices built in
- ✓ Faster development
- ✓ Lower risk
- ✓ Business impact, faster

Start Strong. Build Smart. Deliver Impact.

Accelerate Delivery
Get to production faster

Built on Best Practices
Enterprise-ready from day one

Secure & Governed
Built-in security and governance

Scale with Confidence
Designed to grow with your business

PAppsCAFoundations — a proven foundation, a clear path, faster to value.

Consulting-Grade Methodology

Business decomposition → scope refinement → Dataverse planning → prototype validation → build & deploy.
Encoded in your repo.

Agent-Guided Development

14 scoped instruction files plus `AGENTS.md` — Copilot, Cursor, Claude Code, every agent follows the same rules.

Interactive Setup Wizard

A 9-step wizard verifies prerequisites, scaffolds React + Fluent UI + Dataverse, seeds prototype assets, runs smoke tests.

Testable from Day One

Vitest, Playwright, MSW ship in the scaffold. Smoke tests pass on first run. Mocks let you test before Dataverse exists.

Security-First Auth

1Password CLI integration or AES-256-GCM encrypted secrets. Pre-commit hooks block accidental secret commits.

Foundations Sync

Pull the latest instructions, scripts, and wizard into your downstream project. No fork management. No merge conflicts.

OPEN SOURCE · MIT LICENSED

Start strong. Build smart. Deliver impact.

Clone the template, run the wizard, start building. Your team gets the accumulated lessons of every team that came before.

Open Repo → (<https://github.com/martycarreras-psnl/PAAppsCAFoundations>)

See Setup Path (<https://martycarreras-psnl.github.io/PAAppsCAFoundations/guide.html>)

Start Building (<https://aka.ms/codeappsfoundations>)

If you're building serious enterprise applications, platforms win.

Build with AI speed. Govern with enterprise confidence.

Choose Code Apps when you value:

- ✓ Tenant-resident, BAA-covered data (PHI, PII, regulated)
- ✓ A maturity model from citizen to pro developer
- ✓ Native MCP and agent intelligence
- ✓ Configure-once governance for 1,000+ makers
- ✓ External-facing apps via Power Pages BYOC
- ✓ Freedom to use any frontier AI model in VS Code

Reconsider external vibe platforms when:

- ✗ PHI or other regulated data is in scope
- ✗ You need tenant-wide governance and ALM
- ✗ Repos that don't inherit a common foundation become unmanageable
- ✗ Agent integration is a strategic priority
- ✗ Long-term maintainability matters more than first-week velocity

"The AI coding tool is just the hammer. The platform is the house."

For organizations that value governance, compliance, agent integration, long-term maintainability, and the ability to scale citizen development safely — **especially when PHI is involved** — Power Apps Code Apps with Dataverse is the clear, defensible enterprise choice.
